

Dataset: Most Visited Countries

Part 1: Data Analysis and Insight

1. Data Overview

The selected dataset is “Most Visited Countries,” which contains information about international tourist arrivals in different countries around the world. The dataset includes predicted tourist arrivals for 2024, actual tourist arrivals for 2023 and 2022, and tourism statistics collected from World Bank sources. The purpose of this dataset is to analyse global tourism trends and compare the popularity of countries as international travel destinations.

The dataset consists of: 206 rows (exclude Header Row) , 6 columns

The variables included in the dataset are:

- Country
- Predicted tourist arrivals in 2024
- Tourist arrivals in 2023
- Tourist arrivals in 2022
- World Bank tourist arrival data
- World Bank year

This dataset is useful for understanding tourism recovery, identifying highly visited countries, and analysing changes in international travel patterns over time.

2. Data Cleaning

Missing Values

The dataset was checked for missing values using Excel’s filtering and “Go To Special” functions. **A total of 189 rows containing missing values** were identified in the dataset. These rows were removed to improve data accuracy, consistency, and reliability for further analysis.

Duplicate Rows

Duplicate records were also identified using Excel’s “Remove Duplicates” feature. **Three countries** such as: Eritrea, Montenegro, and Brunei **were duplicated** in the dataset. These repeated entries were removed to ensure that each country was represented only once.

→ After the cleaning process, the dataset became more suitable for descriptive statistical analysis and visualisation.

3. Descriptive Statistics

	A	B	C	D	E	F

Table 1: Descriptive Statistics Summary

After the data cleaning process, the final dataset contained 17 rows (excluding Header Row) and 6 columns. Descriptive statistics were performed for tourist arrivals in 2022, 2023, and the predicted values for 2024 to summarise the main characteristics of the data. The mean tourist arrivals increased from 31.41 million in 2022 to 38.49 million in 2023, while the predicted mean for 2024 is 38.32 million, indicating continued growth in global tourism activities.

The maximum tourist arrival value reached 100 million visitors in 2023, while the minimum values remained between 11 and 13 million visitors across the three years. The standard deviation values ranged from 20.43 to 25.60, suggesting noticeable differences in tourism performance among countries, with some countries attracting significantly more international visitors than others.

4. Insight

Insight 1:

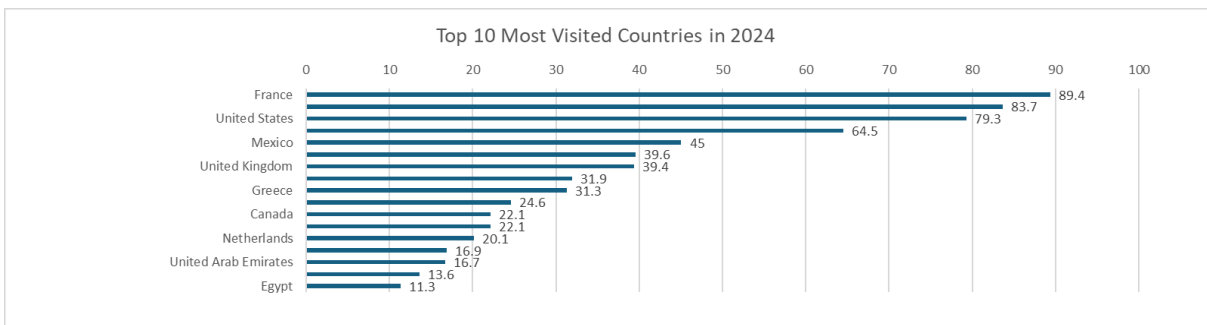

Figure 1: Top 10 Most Visited Countries in 2024

France recorded the highest predicted tourist arrivals in 2024 with 89.4 million visitors, followed by Spain and the United States. This suggests that European countries continue dominating the global tourism market due to their strong tourism infrastructure, cultural heritage, and international accessibility. The result also highlights how countries with well-developed tourism ecosystems recover faster and maintain competitive advantages in attracting international visitors.

Insight 2:

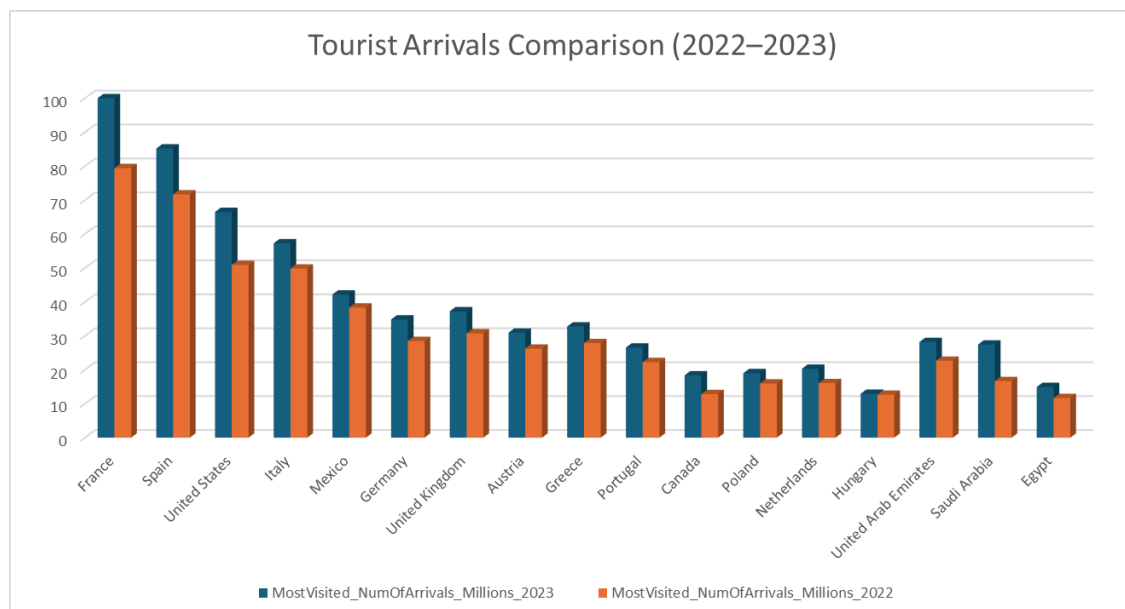

Figure 2: The Comparison of Tourist Arrivals (2022–2023)

The comparison between 2022 and 2023 shows that international tourist arrivals increased across almost all countries in the dataset. France experienced the largest increase, rising from 79.4 million visitors in 2022 to 100 million visitors in 2023, while countries such as Spain, the United States, and Saudi Arabia also recorded strong tourism growth. This suggests that the global tourism industry continued recovering after the COVID-19 pandemic as international travel restrictions were lifted and more people resumed international travel.
